## Rom Helper

Rooting the device lets you access the Android platform's secure /etc partition. As a result, you can make changes to settings, disable security features, hide apps, and even install unsigned applications. A number of Android devices will not boot without the device's unique ID or "factory reset." But once a system is rooted, Android devices can be customized to the owner's liking. Rooting also provides other advantages. There are hundreds of applications, preinstalled apps, and additional features available for mobile devices that aren't possible without root access. How to root a phone:

1. Disable the USB Debugging option on your Android device.
2. Connect your Android device to your computer via USB.
3. Run adb devices command in a terminal. If the device isn't detected, make sure you've enabled USB debugging in settings.
4. Open a terminal window and type `sudo su`. If you're asked to confirm your password, enter it.
5. Type `adb shell` and hit Enter. If prompted for a password, enter your password.
6. Type `su` to change to root user.
7. Type `cd /data` and hit Enter.
8. Type `lsusb` and hit Enter. If a listing of your USB device appears, stop.
9. On Windows, open the Device Manager. Select the problematic device in the drop down list, right-click it and then choose Uninstall.
10. Type `cd /sdcard` and hit Enter.
11. Type `ls` and hit Enter. If a listing of your USB device appears, stop.
12. Type `adb shell`, then type `pm list packages` to get a list of installed packages on your Android device.
13. Find the package that you want to remove, then type `adb shell pm uninstall package_name` and hit Enter.
14. Type `adb shell` and press Enter.
15. Type `exit` and press Enter.
16. Repeat steps 14–15 for every package you want to remove.
17. Type `cd /data` and hit Enter.
18. Type `lsusb` and hit Enter.
19. Type `ls -a` and hit Enter. The output should list all the files you have on your USB device. Stop if no files appear.
20. Delete any file that appears to be a system or other file you don't need.
21. Type `cd /sdcard` and

With more than 18 million downloads, Root Explorer is one of the most popular tools for rooting Android mobile devices. Root Explorer enables users to enable root access on their devices by bypassing the Superuser and installing third-party applications, such as Titanium Backup or SuperSU. In addition to the main app, Root Explorer comes with a "Root Debugger" tool that can be used to debug APK files and get information about system applications and permissions, as well as a "Repair" module that can repair corrupted APK files or verify that the device is unlocked or not, and that rooting is enabled. Seamless navigation Root Explorer is based on a user interface that provides the navigation with a consistent look, even on devices with large screens. It has been designed to be intuitive and user-friendly for new and experienced users alike. With Root Explorer, users can easily access their Android device, view and modify files, display the file system, connect to a server and start the "Repair" module, among other things. All in all, Root Explorer is a highly useful tool for Android users, a fact that is also proven by the hundreds of positive feedbacks the app has received from users around the world. With more than 10 million downloads, SuperSU is one of the most popular tools for rooting Android mobile devices. It enables users to add root access on their devices by installing third-party applications, such as Titanium Backup or SuperSU. To do this, users only have to enable root access on their devices and install SuperSU. Then, they can use the app to install or uninstall any application, as well as to flash, modify or change the permissions of the system applications. With SuperSU, users can also change the default application to start with the device, to remove the default installation of an application or to apply a full system backup. From SuperSU 3.0 to SuperSU 4.0, the latest version of the app, users can get a variety of useful features, such as the ability to use SuperSU without root access or to change the default application without root access. By default, SuperSU will show a progress bar when it is running and provides users with a direct and simple user interface
